PROFESSIONAL SUMMARY

Python Developer and DevOps Engineer with 5+ years designing CI/CD pipelines, automation frameworks, and data tooling adopted by global engineering teams at Intel scale. Driven by a passion for AI-powered automation, with hands-on projects applying LLMs to real workflows and a proven track record of technical leadership and cross-team impact.

SKILLS

- Languages & Scripting:** Python (Advanced), Bash/Shell, SQL.
- DevOps & Cloud:** Docker, GitHub Actions, JFrog Artifactory, CI/CD Pipelines.
- AI & Automation:** LLM Integration, OpenAI-compatible APIs, Prompt Engineering, Unit Testing, Integration Testing, Test Automation.
- Web & APIs:** FastAPI, Flask, Node.js, RESTful API Design.
- Systems & Platforms:** Linux (Ubuntu/RHEL/Alpine), Windows.
- Databases & Tools:** PostgreSQL, MySQL, SQLite, Teradata, Git, Jira.
- Currently Learning:** Kubernetes, TypeScript.

WORK EXPERIENCE

- DevOps Engineer** Mar 2026 - Present
Net2Source Heredia, Costa Rica
- Engineering Python automation scripts for LDAP directory services integration, automating internal group synchronization and eliminating manual administration overhead.
 - Building large-scale Python data analysis pipelines for operational monitoring, accelerating root cause identification and driving data-informed incident resolution.
 - Maintaining and optimizing CI/CD pipelines using JFrog Artifactory and Jenkins; troubleshooting and resolving production incidents to ensure system reliability.
- Software Development Engineer in Test** Jan 2020 - Jun 2025
Intel Corporation Heredia, Costa Rica
- Served as **Product Owner and Technical Lead** for a 6-engineer team under **Scrum and Kanban**, driving releases for a next-gen Xeon CPU (PCIe Gen5, 200+ core architecture) deployed across millions of units; delivered all milestones on schedule despite multiple timeline pull-ins, earning formal leadership and performance recognitions.
 - Architected a Python-based **GitHub version control wrapper** that reduced environment integration time by **99%** (~1 hour to ~10 seconds), eliminating cross-product interoperability bottlenecks; adopted as the standard tool by PPV teams across multiple countries.
 - Owned the team's **CI/CD infrastructure**, building automated pipelines for unit testing, integration testing, static analysis, and automated code-review suggestions; became the cross-product internal reference — other CI/CD owners consulted me to replicate the system.
 - Built and maintained a centralized **Python/Bash automation toolkit** (OOP, SOLID) on GitHub, adopted as standard by multi-country PPV teams; recognized by Principal Engineers for code quality and broad engineering impact.
 - Founded an **innovation working group** securing dedicated resources from stakeholders, and led a structured programming upskilling program (trainings, assessments, and mentorship), raising **60% of the team to advanced proficiency**; one mentee was promoted to Product Owner.
 - Designed a product-agnostic **Python + SQL (Teradata) data extraction standard** with dynamic queries, replacing ad-hoc per-engineer scripts; adopted by engineering and operations to monitor PHIs and support data-driven decisions.

PROJECTS

- TicoRates** — Public Exchange Rate API & MCP Server for Costa Rica github.com/jonach1998/ticorates
- Built an open-source **FastAPI** REST API serving official Costa Rican exchange rates (43 currencies) from the Central Bank (BCCR), with on-demand SQLite caching and concurrent-request deduplication to minimize upstream calls.
 - Shipped an **MCP server published to PyPI** that lets AI assistants such as Claude and Cursor query and convert exchange rates natively.
 - Automated **multi-arch Docker builds (amd64/arm64)** and **GitHub Actions CI/CD** publishing to Docker Hub and PyPI; self-hosted on a Raspberry Pi and **live** with interactive API docs at ticorates.dev/docs.
- JobHound** — AI-Powered Job Hunting Automation github.com/jonach1998/jobhound
- Built an open-source Python tool that scrapes LinkedIn, Indeed, and Computrabajo, scores each listing against a candidate profile using any OpenAI-compatible LLM (0–100 match score), and delivers top matches via Telegram.
 - Designed a multi-profile architecture enabling independent concurrent searches per candidate with zero code changes; profiles are auto-discovered at runtime.
 - Packaged as a **Docker image published to Docker Hub** with automated CI/CD via **GitHub Actions**; uses SQLite for cross-run deduplication and APScheduler for scheduled daily execution.

EDUCATION

- Bachelor Degree in Computer Systems Engineering** Jan 2020 - Present
Fidelitas University San Jose, Costa Rica
- Bachelor Degree in Electronic Engineering** Jan 2016 - Dec 2019
Latin University of Costa Rica San Jose, Costa Rica

LANGUAGES

Spanish (Native), English (Advanced)
